

STORMTRACKER™

Web Animation Software

PRODUCT OVERVIEW

StormTracker™ allows you to animate and share your meteorological satellite data online. You can easily add an unlimited number of geographical regions and data types through the web administrator page. StormTracker™ imports any jpg file, even those not output from a TeraScan® system.

StormTracker™ is useful for interagency use, as well as a method to share environmental data animations with the public. In these times of nearly universal web access, amateur science enthusiasts will enjoy tracking a low pressure system race across their town, watch an eddy travel across the sea, view the seasonal changes in sea surface temperature, and more.

Move your data out of the server room and into the world with StormTracker™. Contact SeaSpace at sales@seaspace.com or 858-746-1100 for information on how to purchase StormTracker™ today.
